

Does the model treat the CEO more deferentially than the analyst?
circle = judge compliance gap, triangle = harmful-action gap (both co-primary outcomes)

n = 140 per persona cell on the five clean arms (7 scenarios x 20 epochs). claude-haiku-4-5 ran on an earlier harness version, before it recorded harmful-action outcomes directly: compliance is n=70 per persona cell (7 scenarios), the harmful-action outcome is reconstructed from recorded actions on 5 of 7 scenarios (n=50 per persona cell) because two scenarios cannot be scored for harm from that earlier run's records.
